PALLIATIVE CARE IN MEDICAID

New Jersey Shows What's Possible

CMS has approved New Jersey's community-based palliative care benefit. It is continued proof that Medicaid can deliver coordinated, patient-centered care to people with serious illness. It decouples palliative care from hospice, so patients no longer give up curative treatment to get support, and early evidence points to better outcomes at little to no added cost. New Jersey gives every other state a proven model to build from.

For patients & families

Care that meets people earlier, before a crisis rather than after.

- **Whole-person support** built around the person, not just the diagnosis.
- **Fewer emergencies** and avoidable hospitalizations, with clearer choices for families.
- **One care team** to navigate an overwhelming system, so no one goes it alone.

For policy

A durable, replicable template that can be used across states.

- **Palliative care as prevention,** decoupled from hospice, so patients keep curative treatment.
- **Aligned with federal priorities,** on prevention and chronic-disease management.
- **Works everywhere:** managed care or fee-for-service, children, or older adults, across the aisle.

What comes next

Backed by three years of Elea Institute funding, TFA Analytics is now working with six more states to design and secure benefits of their own.

TFA Analytics is a population health and total cost of care company that helps payors, providers, and communities improve care for complex populations through facilitating better integration of value-based agreements.

Elea Institute leads national efforts to expand access to high-quality hospice and palliative care. We support patients, caregivers, and health care providers through research, educational resources, grants, and other wide-ranging initiatives.
